

# It's Not **if** your **IT** assets will be attacked, It's **WHEN.**

Somewhere in the world, a disgruntled employee plants a killer virus in his agency's information network. A terrorist plots a cyber-attack on one of our country's power grids. And a hurricane bears down on the command center of a global military network. Improbable? Hardly. Thousands of viruses, intrusions, and denial-of-service attacks strike government and business every year.

That's why so many enterprises keep their information and IT infrastructures secure and operational with the InfoShield™ suite of Information Assurance (IA) tools and services from Northrop Grumman Information Technology. InfoShield solutions establish multiple barriers against virtually anything that humans and Mother Nature can throw at an organization's information assets. And should the unexpected happen, our clients are fully prepared to detect, respond, and recover quickly.

It's no surprise that InfoShield solutions are so effective. We developed them to protect many of the intelligence and defense communities' most sensitive systems. Today, InfoShield safeguards federal, state, local, and commercial systems worldwide. And, we're one of the leading providers of security solutions to the federal government. From global defense networks to multi-jurisdiction public safety systems to patient records at the hospital around the corner, we deliver the in-depth security today's IT-dependent enterprises require.
